1 Design
design file
and its hash
2 Register
record entry
before any run
3 Run
raw outputs,
Merkle root
4 Analyse
registered
script applied
5 Decide
revision action
cites step 2
gates, predictions,
decision rule
pushed before
the job starts
root in the record
before reading
gate failed:
claims unvalidated
rerun registered,
then strengthen
Campaign record: one entry per step, each carrying the hash of the entry before it
